set up cache

```

In [7]: # — Step 0: cache + quaternion prefetch —————
from NEMESIS_pipeline_new_temp_4 import default_NEMESIS_pipeline_settings, p
from typing import Any, Dict, List, Optional, Union
def setup_cache(
    base_root: str,
    sectors: list[int],
    cache_dir: Optional[str] = None,
    quat_dir: Optional[str] = None,
    verbose: bool = True,
) -> dict:
    """
    Create (or point to existing) cache/quaternion directories and prefetch
    quaternions. Call once per session – or once per period group if each
    group has its own pre-existing cache.

    Parameters
    -----
    base_root : root directory for the recovery run. Used to build default
                paths when cache_dir / quat_dir are not provided.
    sectors   : TESS sector integers to prefetch (e.g. list(range(1, 27))).
    cache_dir : optional path to an existing FITS cache directory
                (downloadpath + cache_dir_path). If None, defaults to
                base_root/cache/.
    quat_dir  : optional path to an existing quaternion directory. If None,
                resolved via _resolve_quat_savepath (which typically places
                it inside cache_dir). Pass explicitly when quaternions
                already live elsewhere, e.g. os.getcwd() + '/cache/quaternion'
    verbose   : passed to prefetch_quaternions.

    Returns
    -----
    shared : dict with keys
        'cache_dir'      – absolute path to the FITS cache directory in use
        'quat_savepath' – absolute path to the quaternion directory in use
        'quat_status'    – per-sector status dict from prefetch_quaternions
    """

```

Examples

```
# Fully default – build everything under base_root/cache/  
shared = setup_cache(BASE_OUT, list(range(1, 27)))
```

```
# Re-use existing FITS cache; let quat path resolve automatically  
shared_short = setup_cache(BASE_OUT, list(range(1, 27)),  
                           cache_dir=shortPerpath + 'cache/')
```

```
# Re-use both existing caches explicitly  
shared = setup_cache(BASE_OUT, list(range(1, 27)),  
                     cache_dir=os.getcwd() + '/cache/',  
                     quat_dir=os.getcwd() + '/cache/quaternions/')  
"""

To do:

View all phasefolded diagrams above, mark which ones have phase offsets and then rerun with `refine_t0 = True`. Keep `force_rerun=False`, and `force_relevetter=True` to use cached data and re-apply LEO-Vetter. This should take ~ 30-60 minutes on 225 targets.
